

Technical Information on the Storage of GHH RAND Compressor Airend Lubricants SILOL and SILOL FG

Lubricants do usually not have a shelf life as opposed to food, but they can still age over time. We therefore recommend to provide for certain storage conditions and follow some rules in order to prevent premature ageing:

- Always keep the container in originally closed condition.
- Avoid major temperature fluctuations which cause 'breathing' of the container. Optimum storage temperature is between 10 - 20°C.
- Protect the container against freezing.
- Store the container in a dry place where the air is dry and free of dust. Use air dryers, if necessary.
- Do not store the container in the open.

The places for storing lubricants are subject to legal regulations which may vary depending on the region. Make sure to follow these regulations in all cases.

The lubricants SILOL and SILOL FG are oils without solid matter. When all of the above recommendations are followed, the storage time is 4 years.

Please follow any additional notes and storage rules on the labels.
